Panopticon Enterprise.Net

Panopticon announced the launch of Panopticon Enterprise.Net, a distributed web solution based on Microsoft .Net technology, and the latest addition to the product line.

In Panopticon's latest product, emphasis has been put on ease-of-use while shifting control of the options and settings from the

number of configurable applications which publish treemaps using Internet technologies. A powerful treemap server connects to all available data sources, such as data feeds, spreadsheets and databases and serves an unlimited number of users.

Panopticon Enterprise.Net gives the end-user complete

administrator to the user, giving the user full access and control. "You actually get a treemap application that is using live data installed and up and running in 15 minutes," says Markus Skyttner, CTO of Panopticon. "This is our most exciting product so far".

Panopticon Enterprise.Net can be used to create any

control; the tools available enable powerful data analysis in several dimensions simultaneously. Values can be aggregated or compared on the fly. Objects satisfying multiple criteria can be identified instantly. Overall, the focus has moved from administrator level configurations to user level selections. ■
